Narrative & Impression

MRI BRAIN (INTERNAL AUDITORY CANAL) WITH AND WITHOUT CONTRAST

Referring clinician's provided indication for this examination in Epic: * Vertigo, central; please do IAC views with contrast

Recurrent brief episodes of dizziness/vertigo triggered by nose blowing or sinus irrigation. Evaluation for structural intracranial or internal auditory canal pathology.

TECHNIQUE: Multi-sequence, multi-planar MRI of the brain including high resolution images of the temporal bones was performed before and after intravenous contrast.

COMPARISON: None.

FINDINGS:

Internal Auditory Canals, Cerebellopontine Angles, and Intracranial 7th and 8th Nerve Complexes: No cerebellopontine angle or internal auditory canal mass.

Inner Ear Structures: Preserved signal in the labyrinth. No MRI evidence for an inner ear anomaly.

Brain Parenchyma: No evidence of acute infarct, mass lesion, or hemorrhage.

A tiny focus of susceptibility within the left hemipons demonstrates faint

enhancement (502:205 and 1001:16) consistent with a low flow vascular malformation.

A few nonspecific FLAIR hyperintense foci are present within the bilateral periventricular and subcortical white matter.

Ventricular System and Extra-Axial Spaces: There is no evidence of midline shift or hydrocephalus.

Miscellaneous: Small volume left and trace volume right mastoid fluid. Scattered mild mucosal thickening of the paranasal sinuses.

IMPRESSION:

No MRI evidence of retrocochlear pathology.

ATTESTATION: I, Dr. Manuel Patino Galindo as teaching physician, have reviewed the images for this case and if necessary edited the report originally created by Omer Simitcioglu.
